

Cooperating Intelligent Systems

First-order predicate logic

Chapter 8, AIMA

Why first order logic (FOL)?

- **Logic is a language** we use to express knowledge in rigorous manner
 - consists of syntax and semantics
- **Propositional (boolean) logic** is too limited for a lot of (even simple) domains
 - complex environments cannot be described in a sufficiently natural and concise way
- **First order logic (predicate calculus)** can express a lot more of common-sense knowledge in a reasonable manner

Limitations of propositional logic

Wumpus in (3,1) \Rightarrow Stench in (3,2)

$$W_{31} \Rightarrow S_{32}$$

Propositional logic needs to express this for every square in the Wumpus world.

$A = \text{John has a bike} \wedge B = \text{John has a car}$

Propositional logic cannot express that these two statements are about the same person.

Block B is on top of C $\Rightarrow \neg(\text{C is free to be moved})$

If we have more blocks, we need *a lot* of statements like this.

What we want:

"If there is a Wumpus in square x , then there will be a stench in all *neighboring* squares."

Say it once and for all.

"John has a bike and a car."

...

"People with multiple vehicles watch weather forecasts more often."

"We cannot move an object if there is something on top of it."

First-order logic (FOL)

- **Logical symbols** (always the same meaning)
 - logical connectives: *and*, *or*, *implication*, etc.
 - quantifiers: *for all* (\forall) and *there exists* (\exists)
 - an infinite set of variables: x, y, z, \dots
 - equality symbol and truth constants: $=, T, F$
- **Non-logical symbols** (depend on interpretation)
 - constants (objects): man, woman, house, car, conflict, slawek, stefan, denni, halmstaduniversity, ...
 - predicates (relations between objects): red, green, nice, larger, above, below, schedule, itinerary, ...
 - functions: fatherOf, brotherOf, beginningOf, birthday, employer, flightNumber, slideTitle, man, woman, ...
 - constants are actually a special case of functions

First-order logic (FOL)

Syntax

Constants

A, 125, Q, John, KingJohn, TheCrown, EiffelTower, D215, Wumpus, HH, TravelAgent,...

Relations/predicates (of various arities)

Unary predicates (properties): Orange¹, Nice¹, Rich¹, ...

N-ary relations: Parent², Brother², Married², Before², ...

Function constants (of various arities)

FatherOf¹(KingJohn), LeftLegOf¹(John), NeighborOf¹(HH), DistanceBetween²(A,B), Times²(2,4), Price²(Fruit,Weight), Itinerary³(DepartureAirport, ArrivalAirport, DepartureTime), KingJohn⁰(), A⁰(), 125⁰(), HH⁰(), Agent⁰(), ...

The superscript denotes the "arity" = the number of arguments

R = RichardTheLionheart
 J = KingJohn
 C = Crown

} Object constants

Function constants

LeftLegOf(R)

LeftLegOf(J)

Relations (predicates)

Person(R)

Person(J)

King(J)

Crown(C)

} Unary

Brother(J,R)

Brother(R,J)

OnHead(C,J)

} Binary

First-order logic (FOL)

Syntax

Term

1. An object constant is a term
2. A complete function constant is a term
(complete = all arguments are provided
and each one of them is a term)
3. A *variable* is a term.

Intuitively, a term corresponds to a well-defined object in the world.

First-order logic (FOL)

Syntax

Well-Formed Formula (wff)

1. A complete predicate symbol is a wff
(complete = all arguments are provided and each one of them is a term)
2. An equality between two terms is a wff
3. Negation of a wff is a wff
4. Two wffs connected by a connective is a wff
5. Quantifier (\forall or \exists with a variable) followed by a wff is a wff.

First-order logic (FOL)

Syntax

Variables and quantifiers

Variables refer to unspecified objects in the domain. We will denote them by lower case letters (at the end of the alphabet)

x, y, z, \dots

Quantifiers constrain the meaning of a variable in a sentence. There are two quantifiers:

"For all" (\forall)
Universal quantifier

and "There exists" (\exists)
Existential quantifier

First-order logic (FOL)

Syntax

Variables in wff

1. Variable is said to be *free* in a wff if it occurs in this wff and there is no quantifier *binding* this variable

$\text{Brother}(x,y) \wedge \text{King}(x) \wedge \text{Mother}(x,y) \Rightarrow \text{Woman}(x)$

2. Variable is said to be *bound* in a wff if it occurs in this wff and it is not free

$\forall_x \forall_y \text{Mother}(x,y) \Rightarrow \text{Woman}(x)$

$\forall_y \exists_x \text{Mother}(x,y)$

First-order logic (FOL)

Syntax

Sentence

A well formed formula without any free variables is called a sentence

- Atomic sentence

A complete predicate symbol (relation)

Brother(RichardTheLionheart,KingJohn), Dead(Mozart),
Married(CarlXVIGustaf,Silvia), Orange(Block(C)),...

- Complex sentence

Formed by sentences and connectives

Dead(Mozart) \wedge Composer(Mozart),
 \neg King(RichardTheLionheart) \Rightarrow King(KingJohn),
King(CarlXVIGustaf) \wedge Married(CarlXVIGustaf,Silvia) \Rightarrow
Queen(Silvia)

First-order logic (FOL)

Syntax

Sentence

A well formed formula without any free variables is called a sentence

- Atomic sentence

A complete predicate symbol (relation)

Brother(RichardTheLionheart,KingJohn), Dead(Mozart),
Married(CarlXVIGustaf,Silvia), Orange(Block(C)),...

- Complex sentence

Formed by sentences and connectives

Dead(Mozart) \wedge Composer(Mozart),
 \neg King(RichardTheLionheart) \Rightarrow King(KingJohn),
King(CarlXVIGustaf) \wedge Married(CarlXVIGustaf,Silvia) \Rightarrow
 \Rightarrow Queen(Silvia)

First-order logic (FOL)

Semantics

Semantics assigns truth values to sentences

- terms and wffs that are not sentences do not, in general, have any truth values: $\text{King}(X)$

The truth value of atomic sentences comes from the model/interpretation

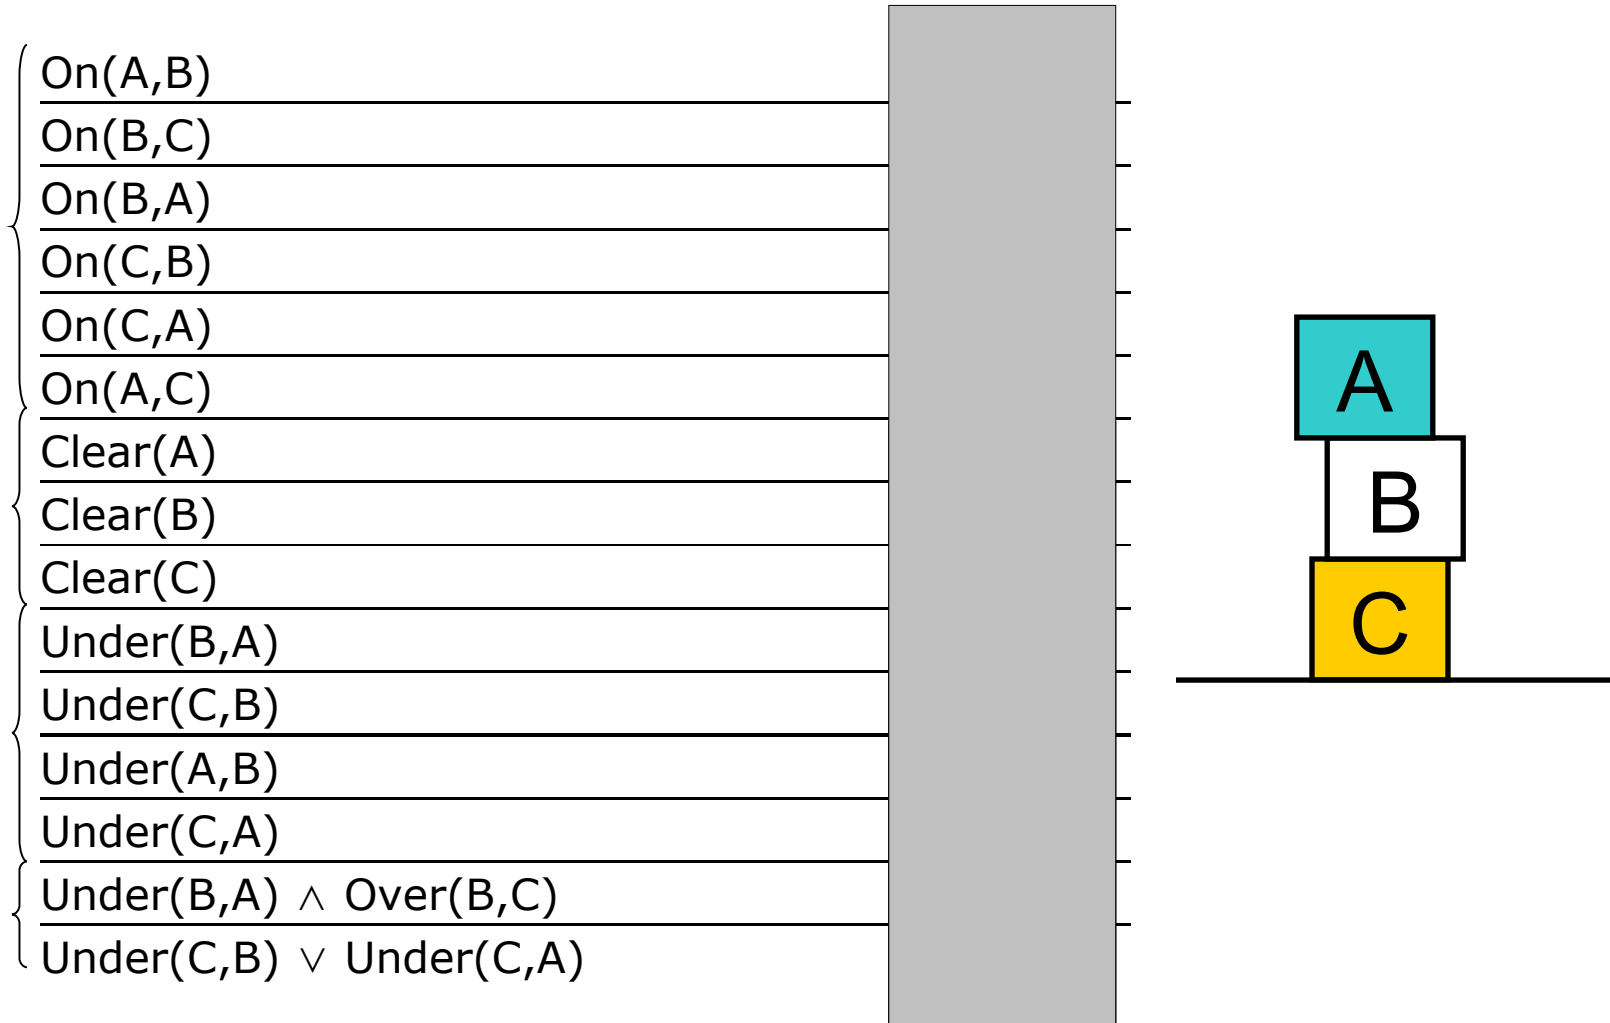

- just like in propositional logic: $\text{King}(\text{Richard})$

The truth value of complex sentences is determined by truth tables

- Quantifiers take into account

domain of discourse: $\forall_x \exists_y X = Y * Y$

Example: Block world

First-order logic (FOL)

Syntax

Variables and quantifiers

(\forall "For all...")

$\forall x \text{ King}(x) \Rightarrow \text{Person}(x)$

"All kings are persons"

$\forall x, y \text{ Brother}(x, y) \Rightarrow \text{Sibling}(x, y)$

"All brothers are siblings"

$\forall x, y \text{ Son}(x, y) \wedge \text{King}(y) \Rightarrow$
 $\text{Prince}(x)$

"All sons of kings are princes"

$\forall x \text{ AISTudent}(x) \Rightarrow \text{Overworked}(x)$

*"All AI students are
overworked"*

$\forall_{\langle \text{variables} \rangle} \langle \text{wff} \rangle$

Everyone at Berkeley is smart:

$$\forall_x \text{ At}(x, \text{Berkeley}) \Rightarrow \text{Smart}(x)$$

$\forall_x P$ is equivalent to the *conjunction of instantiations* of P

$$\begin{aligned} & \text{At}(\text{KingJohn}, \text{Berkeley}) \Rightarrow \text{Smart}(\text{KingJohn}) \\ \wedge & \text{ At}(\text{Richard}, \text{Berkeley}) \Rightarrow \text{Smart}(\text{Richard}) \\ \wedge & \text{ At}(\text{Berkeley}, \text{Berkeley}) \Rightarrow \text{Smart}(\text{Berkeley}) \\ \wedge & \dots \end{aligned}$$

Typically, \Rightarrow is the main connective with \forall

Common mistake: using \wedge as the main connective:

$$\forall_x \text{ At}(x, \text{Berkeley}) \wedge \text{Smart}(x)$$

„Everybody is at Berkeley and everybody is smart“

First-order logic (FOL)

Syntax

Variables and quantifiers

(\exists "There exists...")

$\exists x \text{ King}(x) \wedge \text{Person}(x)$

"There is a king who is a person / There is a person who is a king"

$\exists x \text{ Loves}(x, \text{KingJohn})$

"There is someone who loves King John"

$\exists x \neg \text{Loves}(x, \text{KingJohn})$

"There is someone who does not love King John"

$\exists x \text{ AIstudent}(x) \wedge \text{Overworked}(x)$

"There is an AI student that is overworked"

$\exists_{\langle \text{variables} \rangle} \langle \text{wff} \rangle$

Someone at Stanford is smart:

$$\exists_x \text{ At}(x, \text{Stanford}) \wedge \text{Smart}(x)$$

$\exists_x P$ is equivalent to the *disjunction of instantiations* of P

$$\begin{aligned} & \text{At}(\text{KingJohn}, \text{Stanford}) \wedge \text{Smart}(\text{KingJohn}) \\ \vee & \text{At}(\text{Richard}, \text{Stanford}) \wedge \text{Smart}(\text{Richard}) \\ \vee & \text{At}(\text{Berkeley}, \text{Stanford}) \wedge \text{Smart}(\text{Berkeley}) \\ \vee & \dots \end{aligned}$$

Typically, \wedge is the main connective with \exists

Common mistake: using \Rightarrow as the main connective:

$$\exists_x \text{ At}(x, \text{Stanford}) \Rightarrow \text{Smart}(x)$$

This is true whenever there is somebody not at Stanford

First-order logic (FOL)

Syntax

Nested quantifiers

$\forall x \exists y \text{ Loves}(x,y)$

"Everybody loves somebody"

$\exists y \forall x \text{ Loves}(x,y)$

"Someone is loved by everyone"

$\forall x \exists y \text{ Loves}(y,x)$

"Everyone is loved by someone"

$\exists y \forall x \text{ Loves}(y,x)$

"Someone loves everyone"

$\forall x \exists y \text{ Loves}(x,y) \wedge (y \neq x)$

"Everybody loves somebody else"

First-order logic (FOL)

Syntax

Nested quantifiers

$$\forall x \exists y \text{ Loves}(x,y) \vdash \exists y \forall x \text{ Loves}(x,y)$$

"Everybody loves somebody" \vdash "Someone is loved by everyone"

$$\forall x \exists y \text{ Loves}(y,x) \vdash \exists y \forall x \text{ Loves}(y,x)$$

"Everyone is loved by someone" \vdash "Someone loves everyone"

The order of \forall and \exists matters!

Quantifier duality

DeMorgan's rules

$$\forall x \neg P(x) \quad \equiv \quad \neg \exists x P(x)$$

$$\neg \forall x P(x) \quad \equiv \quad \exists x \neg P(x)$$

$$\forall x P(x) \quad \equiv \quad \neg \exists x \neg P(x)$$

$$\exists x P(x) \quad \equiv \quad \neg \forall x \neg P(x)$$

Ponder these for a while...

Family fun

Family axioms:

"A mother is a female parent"

"A husband is a male spouse"

"You're either male or female"

"A child's parent is the parent of the child" (sic!)

"My grandparents are the parents of my parents"

"Siblings are two children who share the same parents"

"A first cousin is a child of the siblings of my parents"

...etc.

Family theorems:

Sibling is reflexive

© 1998, Jon A. Davis

Write these in FOL

Family fun

Family axioms:

- $\forall_{m,c} (m = \text{Mother}(c)) \Leftrightarrow (\text{Female}(m) \wedge \text{Parent}(m,c))$
or $\forall c \text{Female}(\text{Mother}(c)) \wedge \text{Parent}(\text{Mother}(c),c)$
- $\forall_{w,h} \text{Husband}(h,w) \Leftrightarrow \text{Male}(h) \wedge \text{Spouse}(h,w)$
- $\forall_x \text{Male}(x) \Leftrightarrow \neg \text{Female}(x)$
- $\forall_{p,c} \text{Parent}(p,c) \Leftrightarrow \text{Child}(c,p)$
- $\forall_{g,c} \text{Grandparent}(g,c) \Leftrightarrow \exists_p (\text{Parent}(g,p) \wedge \text{Parent}(p,c))$
- $\forall_{x,y} \text{Sibling}(x,y) \Leftrightarrow (\exists_p (\text{Parent}(p,x) \wedge \text{Parent}(p,y))) \wedge (x \neq y)$
- $\forall_{x,y} \text{FirstCousin}(x,y) \Leftrightarrow \exists_{p,s} (\text{Parent}(p,x) \wedge \text{Sibling}(p,s) \wedge \text{Parent}(s,y))$

Family theorems:

- $\forall x,y \text{Sibling}(x,y) \Leftrightarrow \text{Sibling}(y,x)$

© 1998, Jon A. Davis

Spouse(Gomez,Morticia)
Parent(Morticia,Wednesday)
Sibling(Pugsley,Wednesday)
Sister(Ophelia,Morticia)
FirstCousin(Gomez,Itt)
 $\exists p (\text{Parent}(p,\text{Morticia}) \wedge \text{Sibling}(p,\text{Fester}))$

Family fun

Family axioms:

"A mother is a female parent"

"A husband is a male spouse"

"You're either male or female"

"A child's parent is the parent of the child" (sic!)

"My grandparents are the parents of my parents"

"Siblings are two children who share the same parents"

"A first cousin is a child of the siblings of my parents"

...etc.

Family theorems:

Sibling is reflexive

© 1998, Jon A. Davis

Mathematical fun

- "The square of every negative integer is positive"

- a) $\forall x [\text{Integer}(x) \wedge (x > 0) \Rightarrow (x^2 > 0)]$
- b) $\forall x [\text{Integer}(x) \wedge (x < 0) \Rightarrow (x^2 > 0)]$
- c) $\forall x [\text{Integer}(x) \wedge (x \leq 0) \Rightarrow (x^2 > 0)]$
- d) $\forall x [\text{Integer}(x) \wedge (x < 0) \wedge (x^2 > 0)]$

- a) "Not every integer is positive"

- a) $\forall x [\neg \text{Integer}(x) \Rightarrow (x > 0)]$
- b) $\forall x [\text{Integer}(x) \Rightarrow (x \leq 0)]$
- c) $\forall x [\text{Integer}(x) \Rightarrow \neg(x > 0)]$
- d) $\neg \forall x [\text{Integer}(x) \Rightarrow (x > 0)]$

Mathematical fun

- "The square of every negative integer is positive"

a) $\forall x [\text{Integer}(x) \wedge (x > 0) \Rightarrow (x^2 > 0)]$

b) $\forall x [\text{Integer}(x) \wedge (x < 0) \Rightarrow (x^2 > 0)]$

c) $\forall x [\text{Integer}(x) \wedge (x \leq 0) \Rightarrow (x^2 > 0)]$

b) $\forall x [\text{Integer}(x) \Rightarrow (x \leq 0)]$

c) $\forall x [\text{Integer}(x) \Rightarrow \neg(x > 0)]$

d) $\neg \forall x [\text{Integer}(x) \Rightarrow (x > 0)]$

The Wumpus world revisited

Object constants:

Square $\mathbf{s} = [x,y]$, Agent, Time (t),

Percept $\mathbf{p} = [p_1, p_2, p_3, p_4, p_5]$, Gold

Predicates:

Pit(\mathbf{s}), Breezy(\mathbf{s}), EvilSmelling(\mathbf{s}),
 Wumpus(\mathbf{s}), Safe(\mathbf{s}), Breeze(\mathbf{p}, t),
 Stench(\mathbf{p}, t), Glitter(\mathbf{p}, t), Wall(\mathbf{p}, t),
 Scream(\mathbf{p}, t), Adjacent(\mathbf{s}, \mathbf{r}),
 At(Agent, \mathbf{s}, t), Hold(Gold, t)

| | | | | |
|---|---|---|---|---|
| 4 |  | |  |  |
| 3 |  |    |  |  |
| 2 |  | |  | |
| 1 |  |  |  |  |
| | 1 | 2 | 3 | 4 |

(There are other possible representations)

$\forall x,y,z,w \text{ Adjacent}([x,y],[z,w]) \Leftrightarrow ([z,w] \in \{[x+1,y],[x-1,y],[x,y+1],[x,y-1]\})$

$\forall \mathbf{s} \text{ Breezy}(\mathbf{s}) \Leftrightarrow \exists \mathbf{r} (\text{Adjacent}(\mathbf{r}, \mathbf{s}) \wedge \text{Pit}(\mathbf{r}))$

$\forall \mathbf{s} \text{ EvilSmelling}(\mathbf{s}) \Leftrightarrow \exists \mathbf{r} (\text{Adjacent}(\mathbf{r}, \mathbf{s}) \wedge \text{Wumpus}(\mathbf{r}))$

$\forall \mathbf{s} (\neg \text{EvilSmelling}(\mathbf{s}) \wedge \neg \text{Breezy}(\mathbf{s})) \Leftrightarrow \forall \mathbf{r} (\text{Adjacent}(\mathbf{r}, \mathbf{s}) \wedge \text{Safe}(\mathbf{r}))$

$\forall \mathbf{s}, t (\text{At}(\text{Agent}, \mathbf{s}, t) \wedge \text{Breeze}(\mathbf{p}, t)) \Rightarrow \text{Breezy}(\mathbf{s})$

$\forall \mathbf{s}, t (\text{At}(\text{Agent}, \mathbf{s}, t) \wedge \text{Stench}(\mathbf{p}, t)) \Rightarrow \text{EvilSmelling}(\mathbf{s})$
